1

Q1. a) Convert to simple English sentences

```
i) \pi_{sname}(\pi_{sid}(\sigma_{tagname='PPE'}ProductTag) \bowtie (\sigma_{cost<6}Catalog)) \bowtie Suppliers)
```

Get the names of the suppliers that have PPE that costs less than 6. [Outputs the suppliers that have products tagged with 'PPE' and a cost of less than 6]

```
ii) \pi_{sname}(\pi_{sid}(\sigma_{tagname='PPE'}ProductTag)\bowtie(\sigma_{cost<6}Catalog)\bowtie Suppliers)
```

Nothing is returned from this operation.

 $[(\sigma_{tagname='PPE'}ProductTag) \bowtie (\sigma_{cost<6}Catalog)$ returns the products with tag PPE and cost ; 6, columns are: tid, pid, tagname, sid, pid, cost. Natural join with supplier looks at common sid, so that returns the suppliers with products of tag PPE and cost ; 6. Projecting sid will result in each tuple only having an sid. Projecting the sname of a table where the tuples have only sid results in nothing being returned.]

```
iii) \pi_{sname}(\sigma_{tagname='PPE'}ProductTag)\bowtie(\sigma_{cost<6}Catalog)\bowtie Suppliers )\cap\pi_{sname}(\sigma_{tagname='SuperTech'}ProductTag)\bowtie(\sigma_{cost<6}Catalog)\bowtie Suppliers )
```

Gets the names of the suppliers that offer PPE made by SuperTech that costs less than 6.

```
 \begin{array}{l} \mathrm{iv}) \\ \pi_{sid}( \\ \hspace{0.5cm} (\sigma_{tagname='PPE'}ProductTag) \bowtie (\sigma_{cost<6}Catalog) \bowtie Suppliers \\ ) \cup \pi_{sid}( \\ \hspace{0.5cm} (\sigma_{tagname='SuperTech'}ProductTag) \bowtie (\sigma_{cost<6}Catalog) \bowtie Suppliers \\ ) \end{array}
```

Gets the supplier IDs of suppliers that offer PPE or (inclusive) SuperTech products, both having a cost less than 6.

```
v) \pi_{sname}(\\ (\pi_{sid,sname}(\\ (\sigma_{tagname='PPE'}ProductTag)\bowtie(\sigma_{cost<6}Catalog)\bowtie Suppliers)\\ )\cap(\pi_{sid,sname}(\\ (\sigma_{tagname='SuperTech'}ProductTag)\bowtie(\sigma_{cost<6}Catalog)\bowtie Suppliers)\\ ))
```

Get the names of the suppliers that offer PPE made up SuperTech with a cost less than 6.

Q1. b) Write relational algebra

```
i) \pi_{sname}(\sigma_{(tagname='PPE')\vee(tagname='Testing')}ProductTag \bowtie Catalog \bowtie Suppliers)
ii) \pi_{sid}((\sigma_{tagname='PPE'}ProductTag) \bowtie (\sigma_{cost<10 \land cost>420}Catalog) \bowtie Suppliers))
iii) \pi_{sid}((\sigma_{tagname='PPE'}ProductTag)\bowtie(\sigma_{cost\geq 10 \land cost\leq 1337}Catalog)\bowtie Suppliers))
iv)
R1 := \sigma_{tagname = 'Cleaning'} Product Tag
R2 := \pi_{sid,pid}(R1 \bowtie Catalog)
R3 := \pi_{pid}(R1 \bowtie Catalog)
R4 := R2 \div R3
(or without \div)
R4 := \pi_{R1.sid, Suppliers.pid}(R2 \times Suppliers)
R5 := \rho_{R4(sid,pid)}(R4)
R6 := \pi_{sid}(R5 - R2)
R7 := \pi_{sid}(Suppliers) - R6
v)
R1 := \rho_{S1}(\rho_{(sid,cost)}(\pi_{Suppliers.sid,Catalog.cost}(Catalog \bowtie Product)))
R2 := \rho_{S2}(\rho_{(sid,cost)}(\pi_{Suppliers.sid,Catalog.cost}(Catalog \bowtie Product)))
R3 := \sigma_{S1.cost} > S_{2.cost \cdot 1.2}(\sigma_{S1.sid} != S_{2.sid}(R1 \times R1))
R4 := \rho_{(sid)}(\pi_{S1.sid}(R3))
vi)
R1 := \rho_{P1}(Catalog)
R2 := \rho_{P2}(Catalog)
R3 := P1 \times P2
R4 := \sigma_{(P1.pid=P2.pid)} \land (P1.sid!=P2.sid)(R3)
R5 := \rho_{(pid)}(\pi_{P1.pid}(R4))
vii)
R1 := \sigma_{tagname = 'SuperTech'}(ProductTag) \bowtie Suppliers
R2 := \rho_{R2(sid,cost)}(\sigma_{scountry='USA'}(R1))
R3 := \rho_{R3}(R2)
R4 := \rho_{R4(sid,cost)}(R2 \bowtie_{R2.cost < R3.cost} (R3))
R5 := R2 - R4
R6 := \pi_{sid}(R5)
R1 := \sigma_{tagname = 'SuperTech'}(ProductTag) \bowtie Suppliers
R2 := \rho_{R2(sid,cost)}(\sigma_{scountry='USA'}(R1))
R3 := \rho_{R3}(R2)
R4 := \rho_{R4(sid,cost)}(R2 \bowtie_{R2.cost < R3.cost} (R3))
R5 := R2 - R4 [Most Expensive]
R6 := R2 - R5 [Table excluding most expensive]
R7 := \rho_{R7(sid,cost)}(\sigma_{scountry='USA'}(R6))
R8 := \rho_{R8}(R7)
R9 := \rho_{R9(sid,cost)}(R7 \bowtie_{R7.cost < R8.cost} (R8))
R10 := R6 - R9
R11 := \pi_{sid}(R10)
R1 := \rho_{R1(pid,sid,cost)}(\pi_{Product.pid,Suppliers.sid}(Product \bowtie Catalog))
R2 := \pi_{pid}(R1)
R3 := R1 \div R2
R4 := \sigma_{cost < 69}(R3)
R5 := \pi_{sid}(R4)
```

```
x) \pi_{pid}(Product \bowtie \sigma_{quantity=0}(Inventory))
c)
i) For each pair of suppliers that have a "business relationship" (*1) with each other, find pids they both offer
in their catalog, but which we do not have inventory of. Return the sid for each supplier as sid1, and sid2, as
well as the pid and cost.
- Get the needed columns from subsuppliers
R1 := \pi_{sid,subid}(Subsuppliers)
- Create copies of catalog
R2 := \rho_{C1}(Catalog)
R3 := \rho_{C2}(Catalog)
- Create a table where each business relation is in a tuple with the different combinations of products from
supplier and sub
R4 := R1 \bowtie_{sid=C1.sid} (C1)
R5 := R4 \bowtie_{subid=C2.sid} (C2)
- Get the products in common
R6 := \sigma_{C1.pid=C2.pid}(R5)
- Join with the inventory table to find the ones with 0 quantity
R7 := R6 \bowtie_{C1.pid=Inventory.pid} (Inventory)
R8 := \sigma_{quantity=0}(R7)
- Format into desired format
R9 := \rho_{R9(sid1,sid2,pid,cost)} \pi_{sid,subid,C1,pid,cost}(R8)
ii) Find each pid, find the suppliers that have the products listed in their catalog at the exact same price. Re-
turn columns containing the pid, sid, cost.
R1 := \rho_{C1}(Catalog)
R2 := \rho_{C2}(Catalog)
R3 := C1 \times C2
R4 := \sigma_{C1.pid=C2.pid \land C1.sid!=C2.sid \land C1.cost=C2.cost}(R3)
R5 := \rho_{R5(pid.sid.cost)}(\pi_{C1.pid,C1.sid,C1.cost}(R4))
iii) Find the pids that have been listed as at least 3 different tags. However, one of the tags must be 'PPE',
and one of them must not be 'Super Tech'. Return columns containing the pid, pname, cost.
- Create three copies of the tags
R1 := \rho_A(ProductTag)
R2 := \rho_B(A)
R3 := \rho_C(A)
- Join the tags so each tuple contains three different tags
R4 := A \times B \times C
- We only want the tuples where the pids are also the same, so find those
R5 := \sigma_{A.pid=B.pid \land A.pid=C.pid \land B.pid=C.pid}(R4)
- We don't want two or three of the same tags, so find the tuples containing three distinct tags
R6 := \sigma_{A.tagname!=B.tagname \land A.tagname!=C.tagname \land B.tagname!=C.tagname}(R5)
- Isolate only tuples with their first tag as PPE and second as Super Tech. This also removes duplicates un-
less a product has the same tag twice.
R7 := \sigma_{A.tagname='PPE' \land B.tagname='SuperTech'}(R6)
- Return in the desired format. Duplicates are eliminated again here with the projection operator.
R8 := \rho_{pid}(\pi_{A.sid}(R7))
```

iv) For each pair of "reciprocal subsuppliers" (*2), find all of their "uncommon subsuppliers" (*3). Every uncommon subsupplier of the pair should have only one row. Return the sid of the reciprocal subsuppliers, along with the sid, name and email of the uncommon subsupplier.

 $R9 := R8 \bowtie Catalog \bowtie Product$ $R10 := \rho_{R8.pid,pname,cost}(R9)$ $R1 := \rho_{S1}(Subsuppliers)$

 $R2 := \rho_{S2}(R1)$ $R3 := R1 \times R2$

- Get reciprocal subsuppliers

 $R4 := \sigma_{S1.sid = S2.subid \land S1.subid = S2.sid}(R3)$

 $R5 := \rho_{sid1,sid2}(\pi_{S1.sid,S2.sid}(R4))$

 $R6 := \rho_{R5}(R6)$

 $R7 := \rho_{R6}(R7)$

 $R8 := R5 \times R6$

 $R9 := \sigma_{R6.sid1=R7.sid1 \land R6.sid2!=R7.sid2}(R8)$

 $R10 := \sigma$
